

Where **Technology** meets **Business Objectives**

Data Center Relocations

When moving your IT equipment, you should leave nothing to chance. Abtech can help you efficiently and effectively relocate a single system or your entire data center. We can design a tailor-made solution to minimize the impact on your business.

Abtech's experience in data center relocations spans the globe. For example, Abtech's engineers in Europe can uninstall your systems anywhere on that continent, then crate and ship them to North America, where we would uncrate, re-install, and put your systems straight onto Abtech's 24 x 7 x 365 hardware and software maintenance contract. We will even guarantee a timeline to ship and re-install your systems. If you are in any other part of the world, please contact us to discuss datacenter moves, as we have partners in many other countries.

For the ultimate in data protection, we can have your new data center functional and running in parallel before the "de-installation" of your original production site. We will provide a mirror-image of your systems at your new production location. This includes delivery, uncrating and, if required, dispatching Abtech's highly trained UNIX, Windows, or Linux experts to physically reinstall, reload, and test your new systems. We can also maintain your equipment with a 24x7x365 hardware and software maintenance contract with a 4 hour response. Once you are satisfied with your testing and transfer your operations over to the new data center, our engineers will uninstall the original production system which we would accept back as the return system, saving you a huge amount of downtime and cost.

Our relocation services include:

- **Planning, scheduling and project management**
- **Site evaluation**
- **Dismantling and re-installation**
- **Transportation of your equipment**

Case Study:

Aerospace Company Data Center Move

Challenge: A major telecommunications service provider on a large Caribbean island was experiencing noticeable declines in performance on their production systems. With approximately 160,000 telephone customers, there was an imminent danger of dropping phone calls if the systems were to overload. The Telco needed to upgrade their hardware systems immediately because of an upcoming holiday weekend. They required a minimal effect on daily operations and minimal risk of failure during the upgrade.

Solution: Abtech was notified on a Monday and was able to provide the logistics of setting up a test environment by Wednesday at one of Abtech's nationwide service depots. Once these new systems were tested by Abtech and The Telco engineers, Abtech personnel properly packaged the equipment for safe transport back to the customer's island facility. With Abtech's assistance, the customer was able to upgrade their hardware systems in a very short time frame and with minimal downtime. The Telco will be able accommodate growth for years to come.
